Erectile Dysfunction (ED) and the P-shot

One of the most common concerns affecting men's well-being and their intimate relationships is Erectile dysfunction (ED). ED is the inability to achieve or maintain an erection suitable for sexual intercourse. Erectile dysfunction can affect men as early as their 30s, though it most commonly occurs in men over the age of 40.

What are some of the causes of Erectile Dysfunction (ED)

ED happens when blood flow to the penis is limited, or nerves are damaged. The causes of ED include diabetes, heart disease, prostate cancer treatment, depression, anxiety, and side effects of some medications. Stress, lack of sleep, smoking, and excessive drinking are also factors that can affect ED.

In the United States, more than 39 million men suffer from erectile dysfunction.

What are the treatment options for Erectile Dysfunction?

The P-shot or Priapus shot is a natural method for increasing male enhancement without requiring drugs or invasive surgeries. This treatment uses regenerative medicine products such as plasma where your own blood is used and spun down, amniotic tissue allograft, or human biologics to enhance sexual arousal and help with erectile dysfunction.

If you are looking for better, more natural, and longer-lasting results, the P-shot may be a great option.

How is the Procedure Performed?

The procedure is performed by first numbing the target areas, then injecting the Plasma, amniotic tissue, or human biologics into strategic locations along the patient's penis with a tiny needle. To help maximize the injection effects, a penis pump is used immediately after injection to distribute the Plasma throughout the penis. Patients are encouraged to use a pump regularly to optimize outcomes further.

What is the P-shot used for?

By utilizing the P-shot, men can improve their sexual performance through increased libido, greater size, more stamina, and stronger erections. Thus helping with the following:

- ▶ Erectile dysfunction (ED).
- ▶ Lichen sclerosus - a condition that causes patchy, discolored, thin skin that usually affects the genital and anal areas.
- ▶ Peyronie's disease - a condition in which scar tissue makes the penis curve when it's erect
- ▶ Penis enhancement
- ▶ General sexual function, performance, and orgasm enhancement

- [- WHAT ARE THE ADVANTAGES OF DOING THE P-SHOT?](#)
 - The P-shot helps to restore blood flow, tissue health, and rejuvenation. The P-shot can improve results in all of the following:
 - Strengthening the Penis
 - Immediately larger
 - Straighten the penis
 - Increase circulation
 - Increase sensation and pleasure
 - Make other therapies work better.

Testimonials

Minky B.

★★★★★

Though I was nervous about my procedure, management and staff brought a lighter image my way that made my time at Water's Edge remarkable. Nurse Judy is AMAZING! God Bless you all.

Del G.

★★★★★

I have enjoyed my experience with Waters edge medical, they are taking a personal interest in me and helping me get through my neuropathy issue. I still have a ways to go but I'm sure and have confidence they will continue to help me.

Randy N.

★★★★★

Great help for my neuropathy. Very compassionate and caring staff.
